**7216 Variable Ratio Regulators** are used with nozzle-mix burners to achieve temperature uniformity while using minimum excess air. Molded diaphragms ensure excellent tracking and repeatability, maximum flows, and superior turndown. A high quality stainless steel spring is used to bias 7216 Regulator air/gas ratio. As air rate is turned down towards low fire, gas rate drops faster, giving increasing percentages of excess air (see Figure 2). Reduced total air means greater fuel economy.

Adjustment. Regulators are set at zero bias as shipped. To set regulator bias, loosen locknut at base of spring cartridge, turn spring cartridge counterclockwise (do not remove cap), and retighten locknut. Set as negative as necessary to get temperature uniformity at low fire.

Where available gas pressure at the 7216 inlet is less than 2 osi above maximum combustion air pressure, use a bleeder in the air impulse line. See Bulletin 8654 or Instructions 7218-2.

If 1:1 ratio control is required at all firing rates, a 7218 Ratio Regulator is recommended, rather than a 7216. In some multi-purpose furnaces, 7216 and 7218 Regulators are piped in parallel with an isolation shutoff valve ahead of each. This permits holding constant ratio from high fire to low using the 7218, or variable ratio operation with the 7216.

The 7216 spring gives the regulator the ability to lock-up for use with a By-Pass Kit. The By-Pass Kit is used to maintain low fire with low or no impulse pressure to the regulator. Make sure to set the by-pass flow rate before adjusting the regulator spring to its desired operating point.

Due to size limitations of the regulator body pressure taps and the 1/8” needle valve, a By-Pass Kit is only practical for use on 2” regulator sizes and smaller. For larger sizes a by-pass must be field installed around the regulator. A By-Pass Kit is also offered for adding this option to a regulator already in the field. Order the appropriate kit by the following part number:

- 2-7168-1 By-Pass Kit for 7216-01, -0, -1
- 2-7168-3 7216-2
- 2-7168-4 7216-3
- 2-7168-5 7216-4

REGULATOR SELECTION

To size a regulator, determine required cfh of gas and pressure drop available at high fire. Divide required cfh by Table 2 factor for available pressure drop. Select smallest regulator with Table 1 (2 osi) capacity above this adjusted capacity. Never choose a regulator capacity based on more than 16 osi drop (even if more is available).

SPECIFICATIONS

- Diaphragm Cover and Case: Aluminum
- Body: Cast Iron
- Seat: SST
- Shaft: SST
- Balancing Diaphragm: BUNA/Nylon (Standard) FKM/Polyester (7216-V)
- Gas Diaphragm: BUNA/Nylon (Standard) FKM/Nomex (7216-V)
- Maximum Inlet/Outlet Pressure: 2 psi
- Emergency Pressure: 5 psi (resulting in internal parts damage)

Maximum Ambient Temperature: 180° F (Standard)
Minimum Ambient Temperature: -20° F (Standard and -V)

Low Fire Accuracy at <3”wc impulse:
  - Spring bias setting capabilities: +0.2”wc to –7”wc
  - Repeatability: ±0.05”wc

High Fire Accuracy at 3” to 41.5”wc impulse:
  - Impulse/outlet pressure offset: 0.5 to 5% plus bias on regulator
  - Repeatability: ±0.3”wc

Low Fire By-Pass:
  - 1/8” NPT Brass needle valve (CV .4)
  - Steel tubing, and brass fittings

DIMENSIONS

Install with diaphragms horizontal and above the pipe.

* Threaded companion flanges included in regulator price.
RECOMMENDED INSTALLATION
Install with diaphragm horizontal and above the pipe.

REPAIR AND UPGRADE KITS
For repair and upgrade kits see Sheet 7216/7218/7219A/7349A.

ORDERING INSTRUCTIONS

**The "Standard" regulator now comes with no brass internals, and can be used in place of the obsolete -K model**

DIMENSIONS SHOWN ARE SUBJECT TO CHANGE. PLEASE OBTAIN CERTIFIED PRINTS FROM FIVES NORTH AMERICAN COMBUSTION, INC. IF SPACE LIMITATIONS OR OTHER CONSIDERATIONS MAKE EXACT DIMENSION(S) CRITICAL.

WARNING: Situations dangerous to personnel and property may exist with the operation and maintenance of any combustion equipment. The presence of fuels, oxidants, hot and cold combustion products, hot surfaces, electrical power in control and ignition circuits, etc., are inherent with any combustion application. Parts of this product may exceed 160°F in operation and present a contact hazard. Fives North American Combustion, Inc. urges compliance with National Safety Standards and Insurance Underwriters, recommendations, and care in operation.
